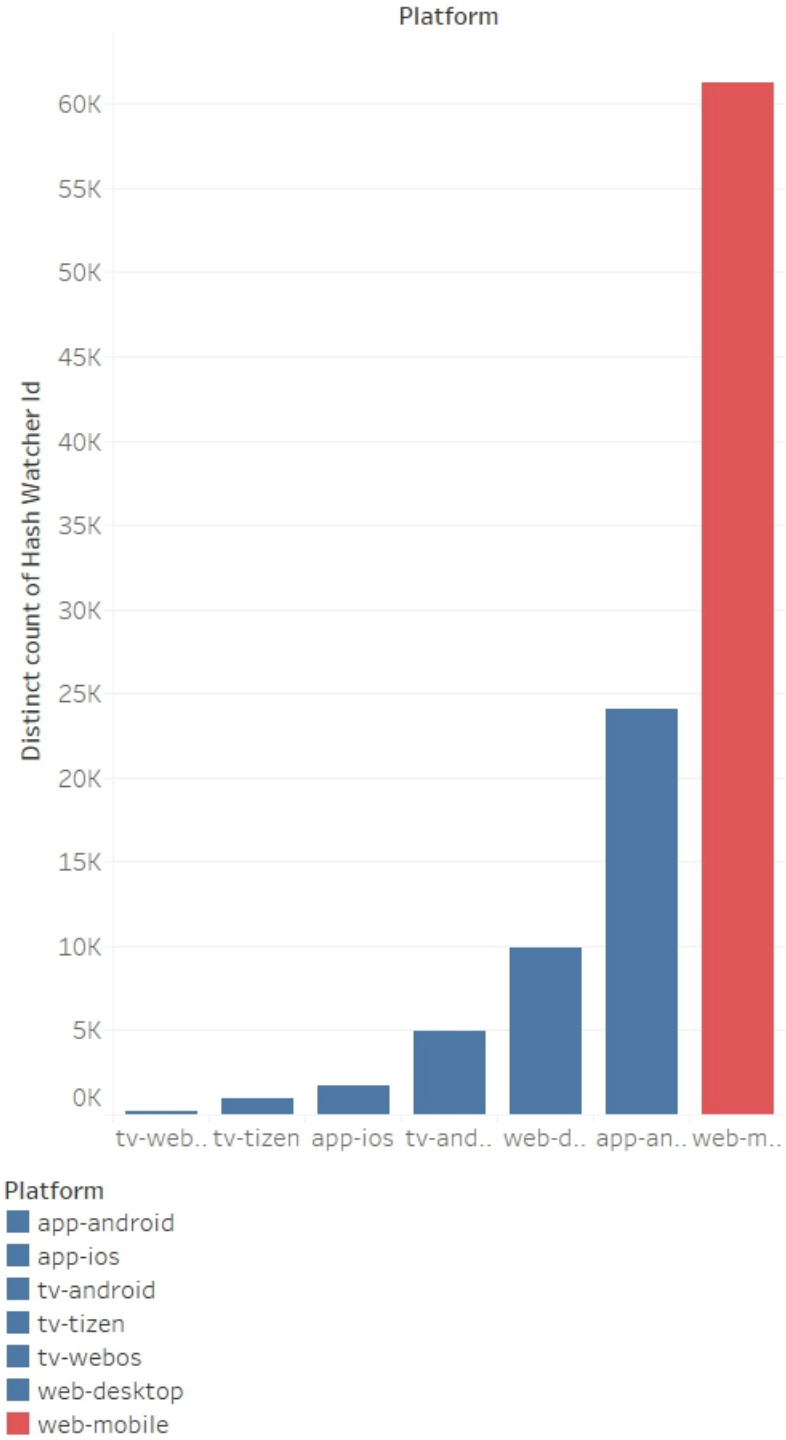
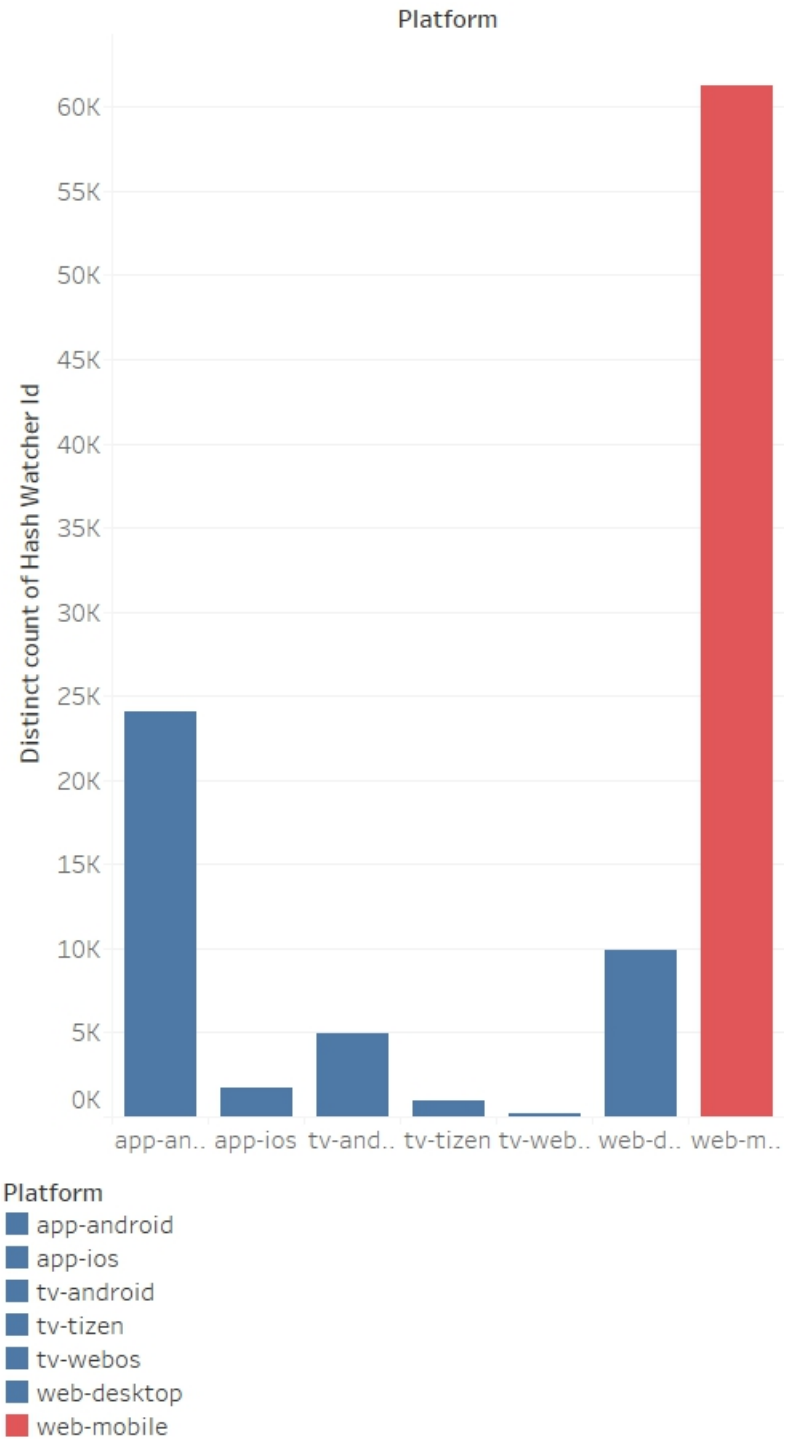
THE PLATFORM THAT USER KEENLY USED TO WATCH

How could we know the platform that user keenly used to watch? And how do you convince us that user are keenly watch on that platform? Before we answer that question, let's see these graphs that show which platform has the most watcher.



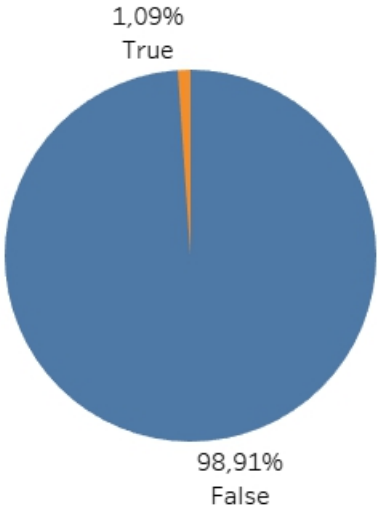


Platform	
web-mobile	61.244
app-android	24.087
web-desktop	9.934
tv-android	4.989
app-ios	1.674
tv-tizen	922
tv-webos	153

Based on those charts, we can see that **web-mobile is the most watched platform**. Now, we need to know why this is happening. We will investigate this further by using another chart that related only to web-mobile.

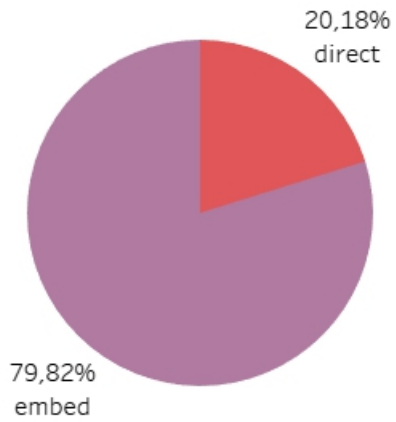
First, we check if web-mobile has ads.

After that, we check are they logging in.

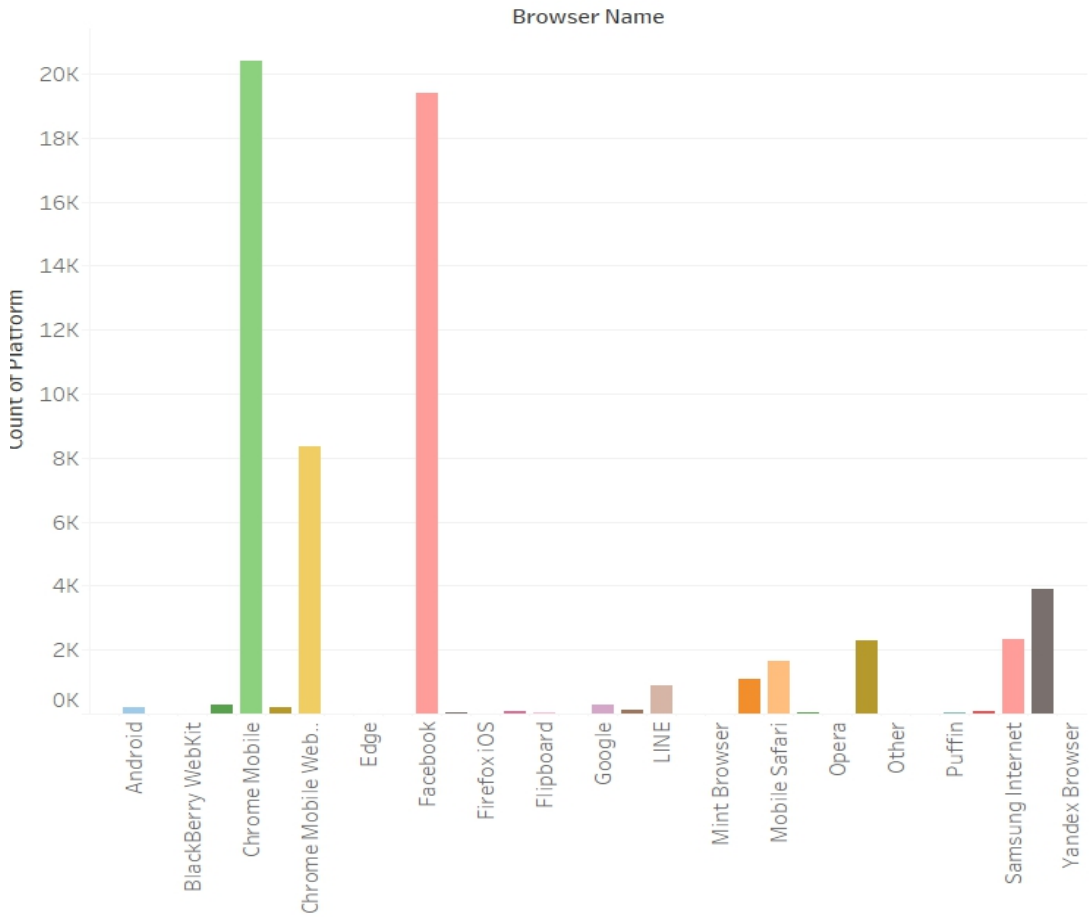


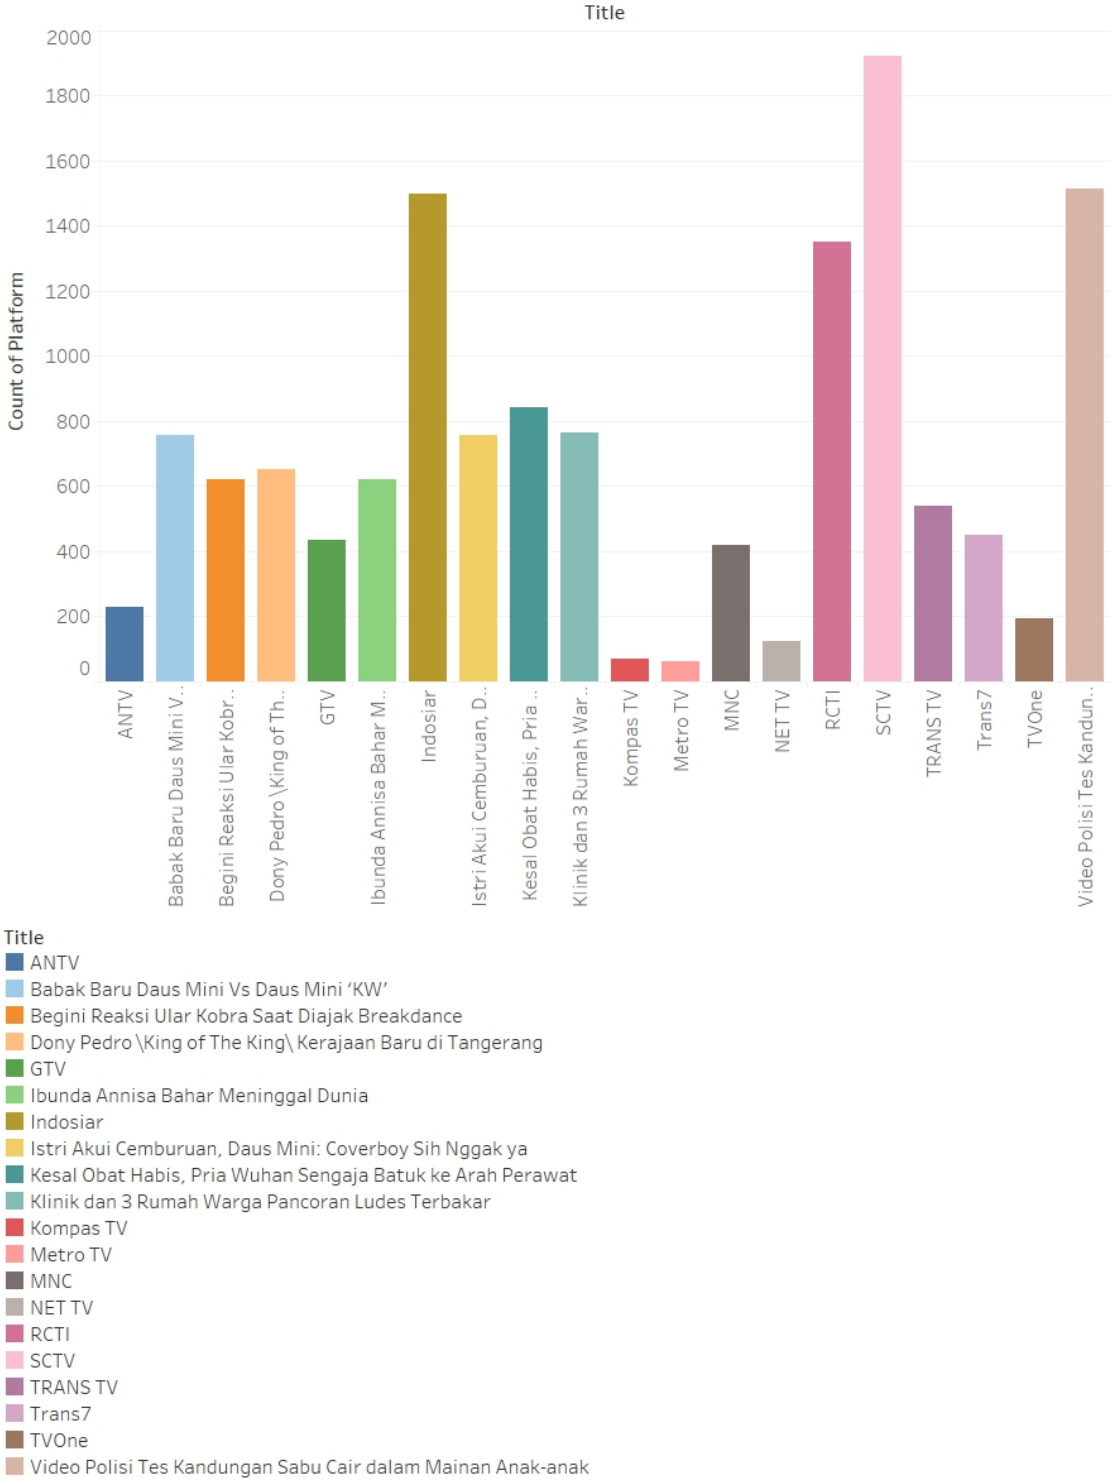
The result is not that far off actually. If you open or view videos from your mobile web application, this is expected. Like there's probably ads and most of the time you're not logged. This didn't help much, so we check another chart.

Pie chart below is from playback location in web-mobile.



Now we know that the majority of the video played is embed. Only 20.18 % are directly played. I suspect this is because the videos directly played are opened in Vidio website. But after clicking outside link. Compared to the graph before, this seems to be the light in the tunnel. Let's see another chart that linked to this, several at a time.





The chart above is from browser used and the title of the video. It doesn't seem strange that in web-mobile the browser chart is dominated by browsers. But hey, is Facebook a browser? Of course not. It directly related to the embed versus direct before. Now you see what I mean? It's not the browser Facebook, but it's played in Facebook. The title chart is filtered to 20 items. Seems strange that there are tv stations in there wasn't it? To see it further, let's see the referrer graph within web-mobile. This graph is filtered so it only shows the top 20 of the referrer.

We can see from the referrer chart the highest is from google, while the chart seems contradict the title chart, which has most of tv stations in high positions. **This is not contradictions**. The tv stations title numbers actually matches with the referrer chart. So the real reason is because most of the viewers first access their web page with google. The second place would be the news website which also dominates the referrer chart. Now, the news web site will have many news do they? This is the answer, most viewers is either searching at google or reading news while getting referred with video. See also the Facebook bar in the chart. It makes sense right? How often do you access Facebook and watch the embedded video, wether it's ads or videos shared by your colleagues?

Now we can draw conclusion from these chart. Why is the web-mobile that have the highest platform count?

It's because the viewers were watching the video from the web browser in their mobile phone.

Why do that specifically?

Most of them were opening related web page which contains the video from Vidio. The video is either related to the news or the thing they are googling, or videos from their social media site. And that is why there are many viewers from web-mobile.
